

Problem:

Write a C program that reads a name and prints a welcome message.

Concept Tested:

printf, variables, strings, basic input/output.

Input Format:

A single string (name).

Output Format:

Print Welcome, <name>!

Test Cases:

Input: Arun → Output: Welcome, Arun!

Input: Leo → Output: Welcome, Leo!

Input: Sara → Output: Welcome, Sara!

Problem:

Write a C program that reads an integer and prints it.

Concept Tested:

Integer data type, scanf, printf.

Input Format:

An integer n.

Output Format:

Print the value of n.

Test Cases:

Input: 5 → Output: 5

Input: 100 → Output: 100

Input: -7 → Output: -7

Problem:

Declare a string variable and print your name.

Concept Tested:

char array, variable declaration.

Output:

Arun

Problem:

Declare an integer variable to store age and print it.

Concept Tested:

int data type.

Output:

18

Problem:

Declare an integer variable to store marks and print it.

Concept Tested:

int variable.

Output:

95

Problem:

Declare a float variable to store salary and print it.

Concept Tested:

float data type.

Output:

25000.50

Problem:

Declare a character variable to store grade and print it.

Concept Tested:

char data type.

Output:

A

Problem:

Declare a float variable to store percentage and print it.

Concept Tested:

float.

Output:

89.75

Problem:

Declare an integer variable to store roll number and print it.

Concept Tested:

int.

Output:

101

Problem:

Declare a string variable to store city name and print it.

Concept Tested:

char array.

Output:

Chennai

Problem:

Declare a character variable to store gender and print it.

Concept Tested:

char.

Output:

M

Problem:

Declare a string variable to store college name and print it.

Concept Tested:

char array.

Output:

ABC College

Problem:

Write a C program that reads a floating-point number and prints it with two decimal places.

Concept Tested:

float, format specifiers.

Input Format:

A float value.

Output Format:

Print the value up to 2 decimal places.

Test Cases:

Input: 3.14 → Output: 3.14

Input: 5 → Output: 5.00

Input: 2.567 → Output: 2.57

Problem:

Write a C program to read a character and print it.

Concept Tested:

char data type.

Input Format:

A single character.

Output Format:

Print the character.

Test Cases:

Input: A → Output: A

Input: z → Output: z

Input: 9 → Output: 9
